

Project Executable Files & Execution Guide

Date	15 JUNE 2026
Team ID	XXXXXX
Project Name	Sustainable Waste Management Assistant Using Generative AI
Maximum Marks	3 Marks

Project Executable Files & Execution Guide:

To successfully evaluate your project, evaluators require access to your source code, live deployments, and clear instructions on how to build and run your application locally. Complete the sections below to document your project repositories and execution steps.

Step 1: Project Links & Access

Resource Type	URL / Access Link
Source Code Repository (e.g., GitHub, GitLab)	https://github.com/fxw1d70-spec/waste-management-assistance
Live Deployed Application (e.g., Vercel, AWS, Heroku)	https://sustainable-waste-manage-2eadb.web.app
Demo Video Link (Optional but recommended)	https://drive.google.com/drive/folders/1FD7E0Abziemmvzebga4jYsuMJhVJSQIU?usp=sharing

Step 2: Key Executable Files & Folder Structure

Briefly explain the primary directories and where the core execution files are located within your repository.

S.No	Folder / File Name	Description & Purpose
1	<i>backend/ : Backend Python service and API.</i>	<i>Core file: backend/app.py — primary Flask/FastAPI entry (main server). Supporting modules: backend/ai_service.py, backend/auth_service.py, backend/store_service.py. Dependencies: backend/requirements.txt.</i>
2	<i>frontend/ : Frontend web app (Vite + React).js]</i>	<i>[Core files: frontend/src/main.jsx — React app entry; frontend/index.html — HTML shell. Pages/components: frontend/src/App.jsx, frontend/src/pages/ (Dashboard, Login, MapPage, Scanner). Env template: frontend/.env.example. Package config: frontend/package.json.</i>
3	<i>firebase.json and .firebaserc</i>	<i>Firebase hosting/configuration for deployment; frontend likely deployed via Firebase.</i>
4	<i>README.md</i>	<i>Project overview and run instructions (start here for setup details).</i>

Step 3: Local Setup & Execution Instructions

Provide a step-by-step guide to installing dependencies and launching the application on a local machine.

Step	Action / Terminal Command	Expected Outcome / Notes
1	<code>git clone {repository_url}</code>	Downloads the project to local machine

2	<code>cd backend && pip install -r requirements.txt</code>	Installs all backend dependencies (Flask, scikit-learn, pandas, etc.)
3	<code>cd frontend && npm install</code>	Installs all frontend dependencies (React, Tailwind, Chart.js, Leaflet.js)
4	Configure <code>.env</code> variables	Setup API keys, Firebase credentials, and DB configs as per <code>.env.example</code>
5	<code>npm start (frontend)</code>	Launches React frontend on <code>localhost:3000</code>
